HR Candidate Evaluation: Junior Power BI Developer

Candidate Summary

Arturo participated in a technical HR interview for the Junior Power BI Developer position. Throughout the evaluation, he demonstrated a robust core technical skillset, particularly in Power Query, DAX formulation, and relational data modeling. He displayed strong analytical thinking, clear communication regarding technical concepts, and a practical understanding of business intelligence workflows within Agile team environments.

Technical Skills Evaluation

Job Description Requirement	Score (1-5)	Evaluation Argument (Based on Interview)
Perform data validation, cleansing, and quality checks	5	Arturo demonstrated excellent knowledge of Power Query. He explained how to use the column quality feature to identify errors and empty columns, and detailed how to handle null values, adjust decimal places, clean text, and filter out inconsistent dates (e.g., dates from 1970).
Basic knowledge of DAX (Data Analysis Expressions)	5	He clearly articulated the fundamental difference between Calculated

Job Description Requirement	Score (1-5)	Evaluation Argument (Based on Interview)
		Columns (row-by-row evaluation, memory intensive) and Measures (dynamic calculation based on context). He also correctly formulated a DAX query using the CALCULATE function to filter sales by the 'electronics' category.
Understanding of data modeling concepts and relational databases	5	Superb explanation of the Star Schema. Arturo clearly explained why using Fact and Dimension tables is superior to a massive flat file, noting that flat files cause severe data redundancy (repeating client and regional data on every transaction).
Experience working with SQL for data querying	3	He correctly identified basic SQL clauses (SELECT, FROM, WHERE) but gave a high-level answer and missed the GROUP BY and SUM() aggregation functions required to calculate total sales by region.

Job Description Requirement	Score (1-5)	Evaluation Argument (Based on Interview)
Assist with troubleshooting report issues and optimizing dashboard performance	4	To address slow dashboards, Arturo correctly suggested checking Power Query to remove unused columns, optimizing DAX measures, and evaluating the data model to ensure it is properly normalized.
Exposure to Agile development methodologies	5	Arturo showed extensive Agile experience. He detailed how he connects to Jira to extract User Stories for specific Sprints, and tracks developer performance by checking statuses like 'Definition of Done' and 'Ready'.

Final Recommendation

Final Recommendation: Hire Recommended. The candidate possesses an exceptionally strong foundation in Power Query, DAX, and Data Modeling, which are the core pillars of Power BI development.
